We sell two types of survey nets both are mounted acc to EN 14 757

One type is the clock method (A) and the second type is the overlock method (B). The difference is that the top mesh either will be connected directly into the topline (B) or you have an extra loop line that is connected to the topline and the meshes are running free on this called running line the with line picture (A). Because it is the same at the bottom line. We produce all types of survey nets to be used at sea or in lake. In our range we have benthic nets, bathypelagic-, mesopelagic- and epipelagic nets. The nets depth from 1,5 meters to about 6 m.

Each net has a loop (closed face eye) (c) in all corners.

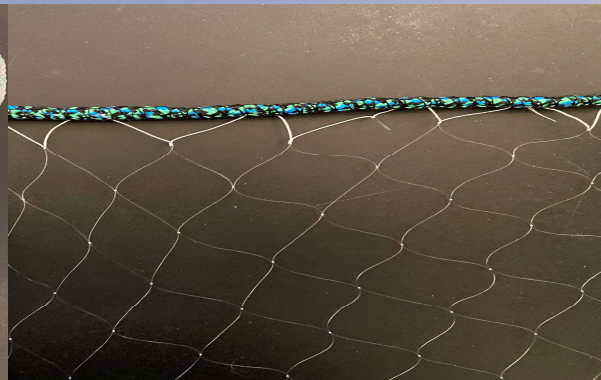

A Clockmethod

C loop

B Overlock method

C loop
